Flight_Project

By Yehuda Briskman

Server

• Step 1:

Open the `server` folder in VSC and enter the terminal. Type: `npm i` (to download all the modules listed in `package.json`).

• Step 2:

In the same initial layer within the `server` directory, create a file named `.env`. This file will contain your most important information, such as your secret passwords.

Inside the file, write these values:

PORT=3001 // port for running

URLS="http://localhost:5173" // what URLs can get access to this server MONGO_URI="mongodb+srv:>>>>>>>>>>some_URL_here<<<<<< </></></>// this is the access URL to your DB in MongoDB... if you don't have one, you can always ask GPT for that...

MODE="development"

SECRET_KEY="<password>" // choose some secret key for your project (access to verify the tokens)

• Step 3:

Now, go back to the command line and you can run the server using the command: `npm run dev`

Client

Step 1:

Open the `client` folder in VSC and enter the terminal. Type: `npm i` (to download all the modules listed in `package.json`).

• Step 2:

Now, go back to the command line and you can run the client using the command: `npm run dev`
